## LIST OF TABLES

1. Description of study sites
2. Physical and chemical properties of soils in different layers of soil pits in the Aravallikkavu, Valluvasseri, Nellikkutha and Pathiri teak plantations
3. The different nutrient treatments
4. Quantity of fertilisers added in different sites
5. Mean values of tree height in the Aravallikkavu 1991 plantation
6. Mean values of tree height in the Aravallikkavu 1990plantation
7. Mean values of tree height in the Valluvasseri 1991 plantation
8. Mean values of tree height in the Valluvasseri 1990 plantation
9. Mean values of tree height in the Nellikkutha 1981 plantation
10. Mean values of basal area of trees in the Nellikkutha 1981 plantation Mean values of volume of trees in the Nellikkutha 1981 plantation
11. Mean values of tree height in the Pathiri 1981 plantation
12. Mean values of basal area of trees in the Pathiri 1981 plantation
13. Mean values of volume of trees in the Pathiri 1981 plantation
14. Initial, final and increment (minimum and maximum) in height of trees and respective nutrient treatments in the different plantations
15. Initial, final and increment (minimum and maximum) in basal area of trees and respective nutrient treatments in the Nellikkutha and Pathiri plantations
16. Initial, final and increment (minimum and maximum) in volume of trees and respective nutrient treatments in the Nellikkutha and Pathiri plantations

#### Abstract

A project was undertaken to study the effect of different nutrients $\mathrm{N}, \mathrm{P}, \mathrm{K}, \mathrm{Ca}$ and Mg on the growth of teak plantations belonging to different rotations. Study sites were selected in one and two year old (1991 and 1990) third rotation plantations at Aravallikkavu and Valluvasseri in Nilambur range of Nilambur North Forest Division and 11 year old (1981) first and second rotation teak plantations, the former at Pathiri in Chedleth range of South Wynad Forest Division and the latter at Nellikkutha in Vazhikkadavu range of Nilambur North Forest Division. In each site, experimental plots of five hectare were laid out and 15 soil pits, three from each ha, were taken. Samples from 0- 20, 20-40 and $40-60 \mathrm{~cm}$ layers of soil pits were collected. The samples from each layer of the three pits were then pooled into one composite soil sample, resulting in five composite soil pits from each site.

The soils were loam except in the Aravallikkavu plantations where the texture was sandy loam in the surface and $20-40 \mathrm{~cm}$ layers and loamy sand in the $40-60 \mathrm{~cm}$ layer. The soils were medium acid in all the layers in the Pathiri, Aravallikavu and Valluvasseri plantations. They were slightly acid in the surface and medium acid in lower layers in the Nellikutha plantation. The site in the Aravallikavu 1991 plantation was highly deteriorated and it was possible to see hard laterites in the surface in certain pockets. Nutrients N, P, K, Ca and Mg, each @ 0, 15, 30 and $45 \mathrm{~g} /$ tree were added through commercial fertilisers. The fertilisers added were Urea for N. Mussorie rock phosphate for P , Muriate of potash for K , Quick lime for Ca and Magnesium sulphate for Mg .

There were 64 nutrient treatments chosen for the experiment by confounding all three and higher order interactions. These nutrient treatments were laid out in randomised complete block design, which were replicated three times in the one year old (1991) plantation at Aravallikkavu, one and two year old (1991 and 1990) plantations at Valluvasseri and eleven year old (1981) plantation at Pathiri whereas they were replicated two times in the two year old (1990) plantation at Aravallikkavu and 11year
old plantation at Nellikkutha. Each treatment was applied to 10 plants in younger plantations (Aravallikkavu and Valluvasseri) and five trees in older plantations (Nellikkutha and Pathiri).

The study revealed that there was significant difference in increment in height of trees in younger plantations while increment in height, basal area and volume of trees in older plantations showed nonsignificance due to nutrient treatments.

Among the different treatments, comparison among means' test showed that $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatment was found to be the best in younger plantations. This is equivalent to the application of 65 g of Urea, 150 g of Mussorie rock phosphate, 58 g of Muriate of potash, 42 g of Quick lime and 149 g of Magnesium sulphate/ tree or 163 kg of Urea, 375 kg of Mussorie rock phosphate, 145 kg of Muriate of potash, 105 kg of Quick lime and 373 kg of Magnesium sulphate/ha. The nutrients have to be added in split doses in the first year during south-west and north-east monsoon periods and double the above amount in split doses in the second and third years during the two monsoon periods. The nonsignificant effect on increment in height in one younger plantation in the, third rotation showed that site evaluation and detailed soil analyses have to be carried out before nutrient recommendation. In other words, nutrient dose is site specific. In order to arrive at the appropriate dose for older plantations, further research is needed.

## 1. INTRODUCTION

Teak (Tectona grandis Linn. f) is the principal forest plantation species in Kerala. The area under teak is around 69,000 ha (KFRI, 1997). Teak is capable of growing over a wide range of edaphic conditions. The quality and distribution of natural teak is related to the nature of the underlying rocks from which the soils are formed while in plantations, among several other factors, the quality will be decided to a large extent by the physical and chemical properties of soils.

In Kerala, out of the total area under teak, 5, 38, 48 and $9 \%$ plantations are in site quality classes I, II III and IV, respectively (KFRI, 1997). Among the different teak plantations, majority are in first rotation, some are in second rotation and rest are in third rotation stages. There is a general apprehension that the productivity of teak in pure plantation would fall in successive rotations. This necessiates all efforts to increase the productivity of existing teak plantations.

In a study in first and second rotation teak plantations in Kerala, Jose and Koshy (1972) reported that soil compaction increased with age of plantations. They also observed that the soil fertility declined in older plantations. Similar results of declining soil fertility in successive rotation teak plantations in Kerala were noted by Balagopalan and Jose (1982). In recent years, application of fertilisers has become a common practice in order to ameliorate the soil conditions and enhance the growth. Teak showed better response to fertilisers at the time of planting though many results are not consistent owing to different soil conditions (Kishore, 1987). Prasad et al (1986) found that fertiliser application in 10 and 20 year old teak plantations of West Mandla boosted the growth.

At present, in Kerala, fertilisers are added on an arbitrary basis, both in nurseries and plantations which have produced, in a few cases, significant effect on growth, while in most other cases, the effect was not promising. Faster growth of plants under the influence of appropriate fertiliser management may even help to alter the developmental stages of the trees and reduce the rotation period. Hence judicious management of plantations with appropriate dosage of fertilisers is a necessary tool both for proper
utilisation of the added nutrients by the plant as well as for economic benefits. This project was undertaken with the following objectives

1. to study the effect of nutrients on the growth of teak plantations belonging to different rotations
2. to develop a package of practices with nutrient inputs for higher productivity of teak.

## 2. STUDY AREAS AND METHODS

### 2.1. Study areas

Study areas were selected in first, second and third rotation teak plantations. For first rotation, study area was in South Wynad Forest Division while it was in Nilambur North Forest Division for second and third rotation plantations, respectively.

### 2.2. Study sites and the soil characteristics

Study sites were selected in one and two year old teak plantations (1991 \& 1990) of the third rotation at Aravallikkavu and Valluvasseri in Nilambur range of Nilambur North Forest Division, 11 year old second rotation plantation (1981) at Nellikutha in Vazhikkadvu range of Nilambur North Forest Division and 11 year old first rotation plantation (1981) at Pathiri in Chedleth range of South Wynad Forest Division (Fig. 1). The description of study sites is given in Table 1.

Table 1. Description of study sites

| Plantations <br> (sites) | Rotation | Year | Range | Division | No. of <br> trees/ha |
| :--- | :---: | :---: | :--- | :--- | :---: |
| Pathiri | I | 1981 | Chedleth | South Wynad | 508 |
| Nellikkutha | II | 1981 | Vazhikkadavu |  | 493 |
| Aravallikkavu | III | 1991 | Nilambur | Nilambur (North) | 2232 |
| Aravallikkavu | III | 1990 | Nilambur | Nilambur (North) | 2147 |
| Valluvasseri | III | 1991 | Nilambur | Nilambur (North) | 2038 |
| Valluvasseri | III | 1990 | Nilambur | Nilambur (North) | 2003 |

Fie. 1. Location of study area

In each site, plots of five hectare were demarcated and three soil pits were taken from one hectare. Samples were collected from $0-20,20-40$ and $40-60 \mathrm{~cm}$ layers of soil pits. The samples from each layer of the three soil pits from one hectare were then pooled into one composite soil sample of each layer, resulting in one pooled soil pit. Thus. there were five composite soil pits from one site.

Analyses were carried out for soil pH , organic carbon, total Nitrogen ( N ), available Phosphorus (P), Potassium (K), Calcium (Ca) and Magnesium (Mg) as per standard procedures in ASA (1965) and Jackson (1958). Soil texture was also determined. The physical and chemical properties of soils are given in Table 2.

The soils in the Valluvasseri, Nellikkutha and Pathiri plantations were loam in the surface $(0-20 \mathrm{~cm})$ as well as in deeper layers $(20-40$ and $40-60 \mathrm{~cm})$. They were sandy loam in the surface and $20-40 \mathrm{~cm}$ layers in the Aravallikkavu teak plantation, while in the $40-60 \mathrm{~cm}$ layer, the texture was loamy sand. The soils were medium acid in all the layers in the Aravallikkavu, Valluvasseri and Pathiri plantations. They were slightly acid in the surface and medium acid in lower layers in the Nellikutha plantation.

Organic carbon, total N, available $\mathrm{P}, \mathrm{K}, \mathrm{Ca}$ and Mg contents in soils in the Nellikutha and Pathiri were relatively higher. In the Aravallikkavu and Valluvasseri plantations. the available P contents were below the limit of determination. Exchangeable bases contents were also very low at Aravallikkavu and Valluvasseri.

It was possible to see hard laterites in the surface in certain pockets in the Aravallikkavu 1991 teak plantation and the soils were found to be highly deteriorated.

### 2.3. Nutrients administered

The nutrients applied were $\mathrm{N}, \mathrm{P}, \mathrm{K}, \mathrm{Ca}$ and Mg . They were given each @ $0,15,30$ and $45 \mathrm{~g} /$ tree. As the nutrients were not able to be administered in elemental form, they were added as commercial fertilisers. The fertilisers added were urea for N , mussorie rock phosphate for P , muriate of potash for K , quick lime for Ca and magnesium sulphate for Mg.

L - Loam ; SL - Sandy loam; LS - Loamy sand.

### 2.4. Design of the experiment

As the nutrient treatment combinations were too large in the present experiment, they were reduced by taking a fraction of the complete set of factorial combination. Thus 64 nutrient combinations were chosen for the experiment by confounding all the three and higher order interactions (Table 3). These nutrient treatments were laid out in randomised complete block design, which were replicated three times in the one year old (1991) plantation at Aravallikkavu, one (1991) and two year old (1990) plantations at Valluvasseri and eleven year old (1981) plantation at Pathiri whereas they were replicated two times in the two year old (1990) plantation at Aravallikkavu and 11 year old plantation at Nellikkutha. Each treatment was applied to 10 plants in younger plantations (Aravallikkavu and Valluvasseri) and five trees in older plantations (Nellikkutha and Pathiri).

### 2.5. Application of fertilisers

Fertilisers were added during north-east monsoon in the first year (1992) in younger plantations around the plants in furrows, 5 cm deep and 15 cm away from the plant, thoroughly mixed with the soil and then filled with soil. In older plantations, fertilisers were applied in four auger holes, diagonally opposite, dug upto a depth of 40 cm , at a distance of 60 cm from the tree. Further application of fertilisers were carried out in the second year (1993) with double the dose of that applied in the first year in split doses during south-west and north-east monsoon periods and during south-west monsoon in the third year (1994). The quantity of fertilisers added/ha in the first year in the Aravallikkavu, Valluvasseri,Nellikkutha and Pathiri plantations are shown in Table 4.

### 2.6. Details of observations taken

The primary observations taken were height $(\mathrm{H})$ in younger plantations and height and girth at breast height $(\mathrm{GBH})$ in older plantations. The measurements were taken at the time of application of the fertilisers in September 1992, after six months (March 1993) and thereafter every twelve months (March 1994,1995 and 1996).

| (508 trees) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

$\mathrm{N}_{1}, \mathrm{~N}_{2}, \& \mathrm{~N}_{3}$, were Urea; $\mathrm{P}_{1}, \mathrm{P}_{2}, \& \mathrm{P}_{3}$, were Mussorie rock phosphate (MRP); $\mathrm{K}_{1}, \mathrm{~K}_{2} \& \mathrm{~K}_{3}$, were Muriate of potash(MOP); Ca $\mathrm{a}_{1}, \mathrm{Ca}_{2}$, \& $\mathrm{Ca}_{3}$, were Quick lime and $\mathrm{Mg}_{1}, \mathrm{Mg}_{2}$ \& Mg 3 were Magnesium sulphate, each @ 15, $30 \& 45 \mathrm{~g} / \mathrm{plant}$.

Basal area (BA) and diameter at breast height (D) were computed. Volume of each tree was estimated using the prediction equation reported by Chaturvedi (1973) which is

$$
\mathrm{V}=0.1217+0.2257 \mathrm{D}^{2} \mathrm{H}
$$

where $\quad V=$ Volume $\left(\mathrm{m}^{3}\right)$
$\mathrm{D}=$ Diameter at breast height (m) and $\mathrm{H}=$ Tree height (m)

Basal area and volume were computed for each tree in older plantations viz.,., Nellikkutha (1981) and Pathiri (1981). Comparison of treatment effectiveness was made separately for height in younger plantations, and basal area and volume in older plantations through analysis of variance, ANOVA (Snedecor and Cochran, 1965). The increment in height, basal area and volume of each tree was computed by subtracting the initial values from the final values. The mean increment among plots receiving different treatments were compared statistically to determine the significance of the difference. The initial growth measurements showed non significance between the treatments in all the plantations. The final growth measurements as well as their increment data were subjected to ANOVA followed by mean comparison test.

Attempts were made to fit the response function using step wise regression to find out the effect of fertiliser inputs on the growth increment.

## 3. RESULTS AND DISCUSSION

### 3.1. Effect of nutrients on height of trees in the Aravallikkavu (1991 and 1990) teak plantations

The mean initial height of trees in the one year old (1991) plantation ranged from 0.84 m to 2.63 m . The mean final height varied from 3.34 m in $\mathrm{N}_{3} \mathrm{P}_{0} \mathrm{~K}_{2} \mathrm{Ca}_{3} \mathrm{Mg}_{3}$ treatment to 5.20 m in $\mathrm{N}_{0} \mathrm{P}_{2} \mathrm{~K}_{3} \mathrm{Ca}_{1} \mathrm{Mg}_{0}$ treatment. The mean increment in height was from 2.44 m in control to 2.68 m in $\mathrm{N}_{2} \mathrm{P}_{1} \mathrm{~K}_{0} \mathrm{Ca}_{1} \mathrm{Mg}_{3}$ treatment (Tables 5 and 15).

In the two year old (1990) plantation; the mean initial height of trees varied from 1.51 m to 3.15 m and the variation in mean final height was from 4.28 m in control to 6.58 m in $\mathrm{N}_{0} \mathrm{P}_{2} \mathrm{~K}_{3} \mathrm{Ca}_{1} \mathrm{Mg}_{2}$ treatment. The mean increment in height differed from 1.45 m in control to 3.59 m in $\mathrm{N}_{0} \mathrm{P}_{1} \mathrm{~K}_{2} \mathrm{Ca}_{3} \mathrm{Mg}_{1}, \mathrm{~N}_{1} \mathrm{P}_{1} \mathrm{~K}_{3} \mathrm{Ca}_{2} \mathrm{Mg}_{0}, \mathrm{~N}_{1} \mathrm{P}_{0} \mathrm{~K}_{0} \mathrm{Ca}_{1} \mathrm{Mg}_{1}, \mathrm{~N}_{3} \mathrm{P}_{0} \mathrm{~K}_{3} \mathrm{Ca}_{3} \mathrm{Mg}_{3}$ and $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatments (Tables 6 and 15).

It was observed that there was no significant difference in initial height of trees in the 1991 and 1990 plantations. With respect to final height of trees, the difference was also found to be nonsignificant. The increment in height of trees in the 1991 plantation was found to be nonsignificant due to nutrient treatments while it differed significantly in the 1990 plantation. This could be attributed to the significant influence of nutrients on growth.

Mean comparison test was carried out for the increment in height of tress in the 1990 plantation in order to find out the best nutrient treatment. Out of 64 treatments, the best group consisted of the following six treatments viz.,., $\mathrm{N}_{3} \mathrm{P}_{0} \mathrm{~K}_{3} \mathrm{Ca}_{2} \mathrm{Mg}_{0}, \mathrm{~N}_{0} \mathrm{P}_{1} \mathrm{~K}_{2} \mathrm{Ca}_{3} \mathrm{Mg}_{1}$, $\mathrm{N}_{1} \mathrm{P}_{1} \mathrm{~K}_{3} \mathrm{Ca}_{2} \mathrm{Mg}_{0}, \mathrm{~N}_{1} \mathrm{P}_{0} \mathrm{~K}_{0} \mathrm{Ca}_{1} \mathrm{Mg}_{1}, \mathrm{~N}_{3} \mathrm{P}_{0} \mathrm{~K}_{3} \mathrm{Ca}_{3} \mathrm{Mg}_{3}$ and $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ and were significantly different from all the others.

Trt. No. 33to 64 are the different nutrient treatments

### 3.2. Effect of nutrients on height of trees in the Valluvasseri (1991 and 1990) teak plantations

In the one year old (1991) plantation, the mean initial height of trees varied from 1.17 m to 3.08 m . The variation in mean final height was from 3.40 m in $\mathrm{N}_{3} \mathrm{P}_{1} \mathrm{~K}_{1} \mathrm{Ca}_{0} \mathrm{Mg}_{2}$ treatment to 5.39 m in $\mathrm{N}_{0} \mathrm{P}_{0} \mathrm{~K}_{0} \mathrm{Ca}_{0} \mathrm{Mg}_{2}$ treatment. The height increment was from 2.14 m in control to 2.38 m in $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatment (Tables 7 and 15).

The mean initial height of trees in the two year old (1990) plantation ranged from 1.84 to 3.82 m . It varied from 3.94 m in $\mathrm{N}_{0} \mathrm{P}_{0} \mathrm{~K}_{0} \mathrm{Ca}_{1} \mathrm{Mg}_{3}$ to 5.99 m in $\mathrm{N}_{2} \mathrm{P}_{3} \mathrm{~K}_{3} \mathrm{Ca}_{0} \mathrm{Mg}_{3}$ for the mean final height. The mean increment in height was from 2.00 m in control to 2.25 m in $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatment (Tables 8 and 15).

The initial and final height of trees in the 1991 and 1990 plantations indicated that there was no significant difference between nutrient treatments whereas the differences in height increment were significant and could be attributed to the significant influence of nutrient treatments.

### 3.3. Effect of nutrients on height, basal area and volume of trees in the Nellikkutha (1981) teak plantation

Tables 9,10 and 11 depict the mean values for initial, final and increment in height, basal area and volume of trees in the 11 year old (1981) Nellikkutha plantation. The results revealed that the initial height ranged from 5.20 m to 12.10 m . The final height varied from 6.49 m in $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{1} \mathrm{Ca}_{3} \mathrm{Mg}_{3}$ treatment to 13.33 m in $\mathrm{N}_{3} \mathrm{P}_{3} \mathrm{~K}_{2} \mathrm{Ca}_{1} \mathrm{Mg}_{0}$ treatment whereas increment in height was from 1.03 m in $\mathrm{N}_{0} \mathrm{P}_{0} \mathrm{~K}_{1} \mathrm{Ca}_{0} \mathrm{Mg}_{0}$ treatment to 1.32 m in $\mathrm{N}_{3} \mathrm{P}_{1} \mathrm{~K}_{1} \mathrm{Ca}_{1} \mathrm{Mg}_{1}$ treatment (Tables 9 and 15).

The initial basal area varied from $26.20 \mathrm{~cm}^{2}$ to $93.55 \mathrm{~cm}^{2}$ while the final one differed from $28.08 \mathrm{~cm}^{2}$ in $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{1} \mathrm{Ca}_{3} \mathrm{Mg}_{2}$ treatment to $100.09 \mathrm{~cm}^{2}$ in $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatment. The increment in basal area revealed that there was no increment in the control while the maximum, $8.87 \mathrm{~cm}^{2}$ was in $\mathrm{N}_{3} \mathrm{P}_{1} \mathrm{~K}_{1} \mathrm{Ca}_{1} \mathrm{Mg}_{1}$ treatment (Tables 10 and 16).

sd - standard deviation
Trt. No. 33 to 64 are the different nutrient treatments

The mean values for initial minimum and maximum volume of trees were $12.83 \times 10^{-2} \mathrm{~m}^{3}$ and $15.53 \times 10^{-2} \mathrm{~m}^{3}$. The mean final values were between $12.96 \times 10^{-2} \mathrm{~m}^{3}$ in $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{1} \mathrm{Ca}_{3} \mathrm{Mg}_{2}$ and $16.17 \times 10^{-2} \mathrm{~m}^{3}$ in $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2} \quad$ treatments. The increment in volume varied from $0.1200 \times 10^{-2} \mathrm{~m}^{3}$ to $0.6350 \times 10^{-2} \mathrm{~m}^{3}$ in control and $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatment, respectively (Tables 11 and 17). The initial as well as final height, basal area and volume and their increments showed that there was no significant difference due to the application of nutrients.

### 3.4. Effect of nutrients on height, basal area and volume of trees in the Pathiri (1981) teak plantation

The initial mean values for minimum and maximum height of trees were 8.22 m and 13.44 m . The corresponding final values were 8.48 m and 13.77 m in $\mathrm{N}_{1} \mathrm{P}_{3} \mathrm{~K}_{0} \mathrm{Ca}_{2} \mathrm{Mg}_{1}$ and $\mathrm{N}_{3} \mathrm{P}_{3} \mathrm{~K}_{3} \mathrm{Ca}_{1} \mathrm{Mg}_{0}$ treatments, respectively. The increment in height ranged from 0.25 m in $\mathrm{N}_{0} \mathrm{P}_{2} \mathrm{~K}_{3} \mathrm{Ca}_{0} \mathrm{Mg}_{1}$ to 0.38 m in $\mathrm{N}_{2} \mathrm{P}_{3} \mathrm{~K}_{3} \mathrm{Ca}_{1} \mathrm{Mg}_{2}$ treatments (Tables 12 and 15).

The mean initial basal area values were between $158.27 \mathrm{~cm}^{2}$ and $319.63 \mathrm{~cm}^{2}$. The final values varied from $158.97 \mathrm{~cm}^{2}$ in $\mathrm{N}_{2} \mathrm{P}_{1} \mathrm{~K}_{0} \mathrm{Ca}_{0} \mathrm{Mg}_{0}$ to $320.80 \mathrm{~cm}^{2}$ in $\mathrm{N}_{3} \mathrm{P}_{3} \mathrm{~K}_{3} \mathrm{Ca}_{1} \mathrm{Mg}_{0}$ treatments. The increment was from $0.70 \mathrm{~cm}^{2}$ in $\mathrm{N}_{2} \mathrm{P}_{1} \mathrm{~K}_{0} \mathrm{Ca}_{0} \mathrm{Mg}_{0}$ to $2.87 \mathrm{~cm}^{2}$ in $\mathrm{N}_{0} \mathrm{P}_{2} \mathrm{~K}_{3} \mathrm{Ca}_{1} \mathrm{Mg}_{2}$ treatments (Tables 13 and 16).

The initial minimum volume of trees was $17.19 \times 10^{-2} \mathrm{~m}^{3}$ and the maximum was 25.54 x $10^{-2} \mathrm{~m}^{3}$. The final volume varied from $17.37 \times 10^{-2} \mathrm{~m}^{3}$ in $\mathrm{N}_{0} \mathrm{P}_{0} \mathrm{~K}_{0} \mathrm{Ca}_{0} \mathrm{Mg}_{2}$ and $\mathrm{N}_{1} \mathrm{P}_{3} \mathrm{~K}_{0} \mathrm{Ca}_{2} \mathrm{Mg}_{1}$ treatments to $25.86 \times 10^{-2} \mathrm{~m}^{3}$ in $\mathrm{N}_{3} \mathrm{P}_{3} \mathrm{~K}_{3} \mathrm{Ca}_{1} \mathrm{Mg}_{0}$ treatment. The increment in volume varied from $0.1500 \times 10^{-2} \mathrm{~m}^{3}$ in $\mathrm{N}_{2} \mathrm{P}_{1} \mathrm{~K}_{0} \mathrm{Ca}_{0} \mathrm{Mg}_{0}$ to $0.4400 \times 10^{-2} \mathrm{~m}^{3}$ in $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{1} \mathrm{Ca}_{3} \mathrm{Mg}_{0}$ treatments (Tables 14 and 17). The initial, final and increment with respect to height, basal area and volume showed that there was no significant difference between treatments.

### 3.5. General Discussion

In the one and two year old (1991 and 1990) teak plantations at Aravallikkavu, it could be seen that there was no general trend with respect to the effect of nutrients on height growth of trees. But the increment in tree height revealed that minimum increment was recorded in the control treatment, in both plantations. The maximum values were recorded in the five different nutrient treatments viz., $\quad \mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$, $\mathrm{N}_{3} \mathrm{P}_{0} \mathrm{~K}_{3} \mathrm{Ca}_{3} \mathrm{Mg}_{3}, \quad \mathrm{~N}_{0} \mathrm{P}_{1} \mathrm{~K}_{2} \mathrm{Ca}_{3} \mathrm{Mg}_{1}, \quad \mathrm{~N}_{1} \mathrm{P}_{1} \mathrm{~K}_{3} \mathrm{Ca}_{2} \mathrm{Mg}_{0}$ and $\mathrm{N}_{1} \mathrm{P}_{0} \mathrm{~K}_{0} \mathrm{Ca}_{0} \mathrm{Mg}_{1}$. The mean height increment was 1.09 times in the $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatment in the 1991 plantation and 2.48 times in the above five treatments in the 1990 when compared with the control.

On a perusal of the results of the tree height in the Valluvasseri plantations, it was possible to see that there was an increment of 1.11 and 1.13 times in the 1991 and 1990 plantations in the $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatment when compared with the control. In both cases, the lowest increment in height was recorded in the control.

The height of trees in the Nellikkutha teak plantation as well as that in the Pathiri showed that the 'increment in height of trees was 1.11 and 1.12 times in the $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ and $\mathrm{N}_{2} \mathrm{P}_{3} \mathrm{~K}_{3} \mathrm{Ca}_{1} \mathrm{Mg}_{2}$ treatments when compared with the control, respectively. The actual increment values were very low.

The basal area of trees in the Nellikkutha plantation showed that there was no appreciable increment in the control treatment while an increment upto $8.87 \mathrm{~cm}^{2}$ was observed in $\mathrm{N}_{3} \mathrm{P}_{1} \mathrm{~K}_{1} \mathrm{Ca}_{1} \mathrm{Mg}_{1}$ treatment. Volume increment values revealed that there was an increment of 5.29 times in the $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatment when compared with the control.

In the Pathiri plantation, the basal area increment was 1.72 times in $\mathrm{N}_{0} \mathrm{P}_{2} \mathrm{~K}_{3} \mathrm{Ca}_{1} \mathrm{Mg}_{2}$ treatment when compared with the control. The volume increment was 1.47 times in the $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{1} \mathrm{Ca}_{3} \mathrm{Mg}_{0}$ treatment in comparison to the control. It was seen that the basal area and volume increments were lowest in the same treatment viz., $\mathrm{N}_{2} \mathrm{P}_{1} \mathrm{~K}_{0} \mathrm{Ca}_{0} \mathrm{Mg}_{0}$ while the highest increments were in different treatments.

Statistical analyses indicated that there was no significant difference in the final height of trees due to nutrient treatments in both the younger and older plantations so also for basal area and volume in older plantations. Analysis of variance showed that the differences in increment in height was mainly attributable to the significant influence of nutrient treatments in the younger plantations, Aravallikkavu 1990 and Valluvasseri 1990 and 1991 plantations. In the case of older plantations, Nellikkutha 1981 and Pathiri 1981, there was no significant difference in increment in height, basal area and volume of trees due to nutrient treatments.

Similar results of non-significant effects on basal area and volume increment of older plantations were recorded by Prasad et al (1986) for 10 and 20 year old plantations of West Mandala. The reason may be that the nutritional requirements of the older plantations would be higher than the dose applied, resulting in non-significant increase in tree volume. The effect of fertilisers on the height of younger plqtations corroborates the findings of Kishore (1987) for the teak plantations in Chandrapur, Maharashtra.

The response function fitted to growth increments showed very low adjusted $\mathrm{R}^{2}$ values in all the plantations. The poor response obtained is suspected to be due to some external factors mainly light, prevailing microclimate, variation in soil properties and other management aspects.

The best group of nutrient treatments with respect to height increment was arrived at by the use of mean comparison test (LSD). Out of the 64 nutrient treatments, in the Valluvasseri 1990plantation, the best group, which is significantly different from all the others, contains the treatments viz., $\mathrm{N}_{3} \mathrm{P}_{2} \mathrm{~K}_{0} \mathrm{Ca}_{2} \mathrm{Mg}_{1}$ and $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ Among these two treatments, the mean height increment value obtained for $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2} \quad(2.25 \mathrm{~cm})$ was slightly higher than that obtained in $\mathrm{N}_{3} \mathrm{P}_{2} \mathrm{~K}_{0} \mathrm{Ca}_{2} \mathrm{Mg}_{2} \quad(2.23 \mathrm{~cm})$ treatment (Table 7). Mean comparison test was carried out for data on height increment in Valluvasseri 1991 plantation. Pair-wise comparison between the nutrient treatments showed that the treatment, $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ was significantly different from all the other treatments with respect to height increment (Table 8).

It was seen that $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ treatment i.e application of 65 g of Urea, 150 g of Mussorie rock phosphate, 58 g of Muriate of Potash, 42 g of quick lime and 149 g of Magnesium sulphate/ plant in the first year was the common best treatment in the Aravallikkavu 1990 and Valluvasseri 1991 and 1990 teak plantations. This is equivalent to application of 163 kg of Urea, 375 kg of Mussorie rock phosphate, 145 kg of Muriate of potash, 105 kg of Quick lime and 373 kg of Magnesium sulphate/ha. Thus addition of the above doses in split doses during south-west and north-east monsoon periods and double the above amount in split doses in the second and third years during the two monsoon periods was found to be the common best treatment.

The available P content of the soil at Aravallikkavu was not within the detectable limits. The general fertility of soils in the third rotation plantations was found to be very low. Hence even the addition of small amount of nutrients could produce considerable effect on the growth. This is discernible in the present study. This may be a reason for the significant effect of nutrients on height increment in respect of younger plantations. In older plantations, as the trees were in both vegetative as well as reproductive growth phases, the added nutrients may not be enough to have significant effect on either height, basal area or volume. Perhaps higher doses than those applied here might produce different results.

The non-significant effect of nutrients on the height increment of trees in the one year old (1991) plantation at Aravallikkavu which was in the third rotation and growing in highly degraded soils revealed that precise site evaluation and detailed soil analyses have to be carried out before recommendation of nutrients and their dosages. This also suggests that nutrient recommendation should be site specific and cannot be generalised.

## 4. CONCLUSIONS

1. The study in the younger teak plantations in the third rotation and older plantations in the second and first rotations under different soil conditions showed that there was significant effect on the increment in height of younger plantations while there was no effect on increment in height, basal area and volume of trees in older plantations due to the application of nutrients.
2. Among the different nutrient treatments, $\mathrm{N}_{2} \mathrm{P}_{2} \mathrm{~K}_{2} \mathrm{Ca}_{2} \mathrm{Mg}_{2}$ ie application of 65 g of Urea, 150 g of Mussorie rock phosphate, 58 g of Muriate of potash, 42 g of Quick lime and 149 g of Magnesium sulphate/ plant or 163 kg of Urea, 375 kg of Mussorie rock phosphate, 145 kg of Muriate of potash, 105 kg of Quick lime and 373 kg of Magnesium sulphate/ha in split doses in the first year during south-west and northeast monsoon periods and double the above amount in split doses in the second and third years during the two monsoon periods was found to be the best.
3. The study revealed that precise site evaluation and detailed soil analyses have to be carried out before recommending the dosage for fertilisers.
4. The nutrient requirements and the dosage are site specific.
5. For older plantations, further research is needed to arrive at the required nutrient dosage.
